- **Regression:** output variable takes continuous value
- **Classification:** output variable takes class label. Can produce probability of belonging to a particular class

High Level Feature Detection

Let's identify key features in each image category

Nose,
Eyes,
Mouth

Wheels,
License Plate,
Headlights

Door,
Windows,
Steps

Learning Visual Features

Fully Connected Neural Network

Fully Connected Neural Network

Input:

- 2D image
- Vector of pixel values

Fully Connected:

- Connect neuron in hidden layer to all neurons in input layer
- No spatial information!
- And many, many parameters!

Fully Connected Neural Network

Input:

- 2D image
- Vector of pixel values

Fully Connected:

- Connect neuron in hidden layer to all neurons in input layer
- No spatial information!
- And many, many parameters!

How can we use **spatial structure** in the input to inform the architecture of the network?

Using Spatial Structure

Input: 2D image.
Array of pixel values

Idea: connect patches of input
to neurons in hidden layer.
Neuron connected to region of
input. Only "sees" these values.

Using Spatial Structure

Connect patch in input layer to a single neuron in subsequent layer.

Use a sliding window to define connections.

How can we **weight** the patch to detect particular features?

Applying Filters to Extract Features

- 1) Apply a set of weights – a filter – to extract **local features**
- 2) Use **multiple filters** to extract different features
- 3) Spatially **share** parameters of each filter
(features that matter in one part of the input should matter elsewhere)

Feature Extraction with Convolution

- Filter of size 4x4 : 16 different weights
- Apply this same filter to 4x4 patches in input
- Shift by 2 pixels for next patch

This “patchy” operation is **convolution**

- 1) Apply a set of weights – a filter – to extract **local features**
- 2) Use **multiple filters** to extract different features
- 3) **Spatially share** parameters of each filter

Feature Extraction and Convolution A Case Study

Feature Extraction and Convolution A Case Study

X or X?

-1	-1	-1	-1	-1	-1	-1	-1	-1

Feature Extraction with Convolution

- 1) Apply a set of weights – a filter – to extract **local features**
- 2) Use **multiple filters** to extract different features
- 3) **Spatially share** parameters of each filter

Convolutional Neural Networks (CNNs)

Convolutional Neural Networks (CNNs)

CNNs for Classification

1. **Convolution:** Apply filters to generate feature maps.
2. **Non-linearity:** Often ReLU.
3. **Pooling:** Downsampling operation on each feature map.

 `tf.keras.layers.Conv2D`

 `tf.keras.activations.*`

 `tf.keras.layers.MaxPool2D`

Train model with image data.
Learn weights of filters in convolutional layers.

Convolutional Layers: Local Connectivity

`tf.keras.layers.Conv2D`

For a neuron in hidden layer:

- Take inputs from patch
- Compute weighted sum
- Apply bias

Convolutional Layers: Local Connectivity

 `tf.keras.layers.Conv2D`

4x4 filter: matrix
of weights w_{ij}

$$\sum_{i=1}^4 \sum_{j=1}^4 w_{ij} x_{i+p,j+q} + b$$

for neuron (p,q) in hidden layer

For a neuron in hidden layer:

- Take inputs from patch
- Compute weighted sum
- Apply bias

- 1) applying a window of weights
- 2) computing linear combinations
- 3) activating with non-linear function

CNNs: Spatial Arrangement of Output Volume

Layer Dimensions:

$$h \times w \times d$$

where h and w are spatial dimensions
 d (depth) = number of filters

Stride:

Filter step size

Receptive Field:

Locations in input image that
a node is path connected to

```
tf.keras.layers.Conv2D( filters=d, kernel_size=(h,w), strides=s )
```

Introducing Non-Linearity

- Apply after every convolution operation (i.e., after convolutional layers)
- ReLU: pixel-by-pixel operation that replaces all negative values by zero. **Non-linear operation!**

Rectified Linear Unit (ReLU)

$$g(z) = \max(0, z)$$

 `tf.keras.layers.ReLU`

Pooling

x ↑

1	1	2	4
5	6	7	8
3	2	1	0
1	2	3	4

→ y

max pool with 2x2 filters
and stride 2

```
tf.keras.layers.MaxPool2D(  
    pool_size=(2,2),  
    strides=2  
)
```

6	8
3	4

- 1) Reduced dimensionality
- 2) Spatial invariance

How else can we downsample and preserve spatial invariance?

Representation Learning in Deep CNNs

CNNs for Classification: Feature Learning

1. Learn features in input image through **convolution**
2. Introduce **non-linearity** through activation function (real-world data is non-linear!)
3. Reduce dimensionality and preserve spatial invariance with **pooling**

CNNs for Classification: Class Probabilities

CONV and POOL layers output high-level features of input
Fully connected layer uses these features for classifying input image
Express output as **probability** of image belonging to a particular class

$$\text{softmax}(y_i) = \frac{e^{y_i}}{\sum_j e^{y_j}}$$

Putting it all together

```
import tensorflow as tf

def generate_model():
    model = tf.keras.Sequential([
        # first convolutional layer
        tf.keras.layers.Conv2D(32, filter_size=3, activation='relu'),
        tf.keras.layers.MaxPool2D(pool_size=2, strides=2),

        # second convolutional layer
        tf.keras.layers.Conv2D(64, filter_size=3, activation='relu'),
        tf.keras.layers.MaxPool2D(pool_size=2, strides=2),

        # fully connected classifier
        tf.keras.layers.Flatten(),
        tf.keras.layers.Dense(1024, activation='relu'),
        tf.keras.layers.Dense(10, activation='softmax') # 10 outputs
    ])
    return model
```

Amini+ ICRA 2019.

Deep Learning for Computer Vision: Impact

Deep Learning for Computer Vision: Summary

Foundations

- Why computer vision?
- Representing images
- Convolutions for feature extraction

CNNs

- CNN architecture
- Application to classification
- ImageNet

Applications

- Segmentation, image captioning, control
- Security, medicine, robotics
